Li-Ying Chen

Software Engineer | Backend Systems & Data Engineering

Taipei, Taiwan | cliying94@gmail.com | GitHub | LinkedIn

Software engineer with **5+ years of experience** in B2B healthcare and analytics. Build **Python/SQL migration workflows and backend services** from undocumented schemas and business rules, with validated transformations. Current work includes billing logic and third-party device APIs.

TECHNICAL SKILLS

Backend: Python / FastAPI, TypeScript / Node.js / Fastify, Java / Spring Boot, REST / OpenAPI

Data: SQL, PostgreSQL, SQL Server, MySQL, ETL, XML-to-relational mapping, window functions, reconciliation

Delivery: Docker, GCP, Firebase, Cloudflare Workers, GitHub Actions, Pytest, Jest / Vitest

EXPERIENCE

Software Engineer | Dentall Co., Ltd.

June 2022 - Present | Taipei | B2B cloud healthcare software

Migration ownership & backend delivery

- Own Python/SQL migrations across **5 HIS products**, translating undocumented schemas and clinical/claims rules into validated transformations. Tooling supported onboarding for **20% of new clinic customers in 2025**.
- Built SQL Server XML-to-relational transformations, pre-flight validation and resumable checkpoints; validated outcomes through XML reconciliation and successful insurance claim submissions.
- Delivered configurable questionnaire conversion with validated spreadsheet/CSV inputs, legacy fallback and per-run configuration snapshots, replacing hard-coded customer mappings.
- Consolidated patient-search APIs, extracted drug reference data into a shared service and added request-ID tracing in GCP logs.
- Direct AI-assisted development through scoped tasks, code review and regression/CI checks against actual inputs and outputs; contributed **150+ merged PRs and 120+ reviews** across 8 repositories.

Billing workflows & third-party device APIs | Implementation in progress

- Design and implement complex billing logic in Java/Spring Boot: model lifecycle transitions, make prior-stage amounts immutable and calculate subsequent changes as settlement deltas.
- Separate transaction ownership from mutable amounts: define patient-level locking for the selected bills and resolve concurrent-edit edge cases with product, frontend and senior engineers.
- Proposed the integration architecture and designed over half of the vendor-facing API specification; implement TypeScript/Fastify APIs with capability-based authorisation for third-party self-service devices.

Database Programmer / Maintainer | Kantar Taiwan, Kantar Group

April 2021 - May 2022 | Taipei

- Independently delivered customer-specific ETL features for an internal BI platform using **SQL Server and C#**, including personal-data workflows under **GDPR requirements**.
- Collaborated with cross-regional teams in English across cultures and time zones; authored **technical specifications**, data-flow documentation, field definitions and library usage guides.

SELECTED PROJECT

LLM-backed scam detector & Cloudflare Workers gateway | App / Gateway

Mentored **4 classmates** through an Android app and serverless gateway delivery, from initial scaffold to **v2.1.3 in 3 weeks**.

EDUCATION & COMMUNITY

Fu Jen Catholic University | Software Engineering & Digital Innovation Application, 2024-2026. Completed core computer science coursework; degree not completed. B.A., Italian Language & Culture, 2014-2019.

Taipei.py: Co-organiser | **PyCon Taiwan:** Volunteer since 2021; 2026 Program Team and English-language keynote host.

Languages: Mandarin (native), English (professional working proficiency), Italian (intermediate), German (beginner).
